

Validations Summary

We validate the background luminances, the background-pair (hi vs. low) contrast, and the flicker contrast for the flicker direction on each background at nominally 5%. These are in files named `luminancesBackgrounds.csv`, `contrastsBackgrounds.csv`, and `contrastsFlicker.csv`, respectively, for each session – each session being a `$PARTICIPANT/$SESSION/` subdirectory. We read in all of these, and concatenate into a single dataframe per validation-type.

```
luminancesBackgrounds = luminancesBackgrounds %>% filter(label != 'PreCorrection')
contrastsBackgrounds = contrastsBackgrounds %>% filter(label != 'PreCorrection')
contrastsFlicker = contrastsFlicker %>% filter(label != 'PreCorrection')
```

Warning: Removed 15 rows containing missing values (geom_point).
